LEVEL 5

Brain hurts from all the  
call-stacks ...

Mr. Rabbit!! Psssssst

[ in a blink of an eye, the white  
rabbit hops its way towards a  
wall of green text ... ]

## New in Level 5:

Function calls

The functions can now call other functions. A function call is identified with the token **call** and followed by an **expression** that will be resolved to the index of the function that will be called.

The **expression** can be an **integer**, **variable** that contains an integer or **function call** that returns an integer.

A call statement can be used as one of the following cases:

- As a value for another statement (variable creation, variable assignment, print, if condition, return or function call)
- As a separate statement

When a function is called within a function, then the execution continues in the called function.

Once the called function has executed all of the statements (possibly other function calls) or reaches a return statement, the execution continues in the calling function. A function that does not execute a return statement will always return **true** as default returned value.

If the **expression** of a call statement **cannot be** resolved to an integer that corresponds to a **valid index** of a function, it will produce an **error** and terminate the program.

*In this level* all variable names used in functions will be unique.

Considering these changes execute all the functions like in the previous levels.

	Input	Output
Example1	<pre> 23 start var thisis false call 2 var x 3 if call x print call 4 end else print hi end end start print functiontwo end start return true end start print thisis end start call string end </pre>	<pre> functiontwothisistrue functiontwo  thisis ERROR </pre> <p>Hint: notice that function 1 produces the output 'functiontwothisistrue'. The true in the end is because a function without a return value returns true.</p> <p>Hint 2: even though function 1 has a variable of the name thisis, when called function 4 prints the string thisis because the variable only exists in function 1</p>

	Input	Output
Example2	<pre> 12 start print call call call call call 3 end start call call 4 end start return 3 end start print noreturn end </pre>	<pre> 3 ERROR  noreturn </pre>

**Good**  
**LUCK!**
